1.The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-43, 56-68, 71 and 73-80 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hoffman et al in view of Ishikawa et al.

Hoffman et al is applied for reasons of record, the primary reference essentially failing to show the aspect of employing a coextrusion or extrusion coating a removable core or membrane material to form a hollow fiber. Ishikawa et al does this and such would have been an obvious coating process in lieu of the other methods generally taught in Hoffman et al dependent on the exact material used the core/removable substrate material.

2.Claims 44-55 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hoffman et al generally for reasons of record.

Instant claims 44-55 continue to remain rejected, the use of a swellable material to form the hollow fiber submitted to be obvious over the material taught in Hoffman et al dependent on the exact material desired for the hollow fiber membrane. Swelling polymers which have been deposited on removable substrates is a conventional method of removing the substrate once the polymer has solidified and such is considered to have been well within the skill level of the art.

3.Applicant's arguments with respect to the claims have been considered but are moot in view of the new ground(s) of rejection.

Art Unit: 1732

Applicant's comments concerning the lack of a teaching of coextruding in Hoffman et al have been addressed with the application of Ishikawa et al, which clearly teaches this. While it is recognized that Hoffman et al does not explicitly teach a polymer material to make the fiber which is swelled to remove the core, such a removal of a solid core is submitted to be well known in the art and would have been an obvious modification to the general process shown in Hoffman et al dependent on fiber and core material used.
